

Companies rarely fail due to poor planning. They fail because the world changes while the plan is being executed, and those at the helm continue steering by assumptions that used to be true but no longer are.

Every strategy depends on CONVICTIONS – things the company holds to be true.

| *Customers will pay a premium.*

| *A critical regulation will remain in force.*

| *We have a sustainable first-mover advantage.*

These aren't facts. They're strategic convictions, and every major decision depends on them. The problem isn't that these convictions are wrong – it's that they're usually revisited only after disappointing results force the issue. By then, months – or even years' worth – of decisions about product, people, and capital have compounded on assumptions that no longer reflect reality.

There's a name for this in navigation – where you estimate your current position based only on where you've been, without checking against your surroundings:

Dead reckoning.

It works – until the world changes. Most companies run strategy the same way: they establish a direction and execute relentlessly, but no one checks whether they're still on course. Dead reckoning fails because unmeasured drift from wind and current compounds over distance. It wrecked ships for centuries. It does the same to strategy.

Every critical business function has infrastructure that keeps it connected to reality.

Finance has ERP. Sales has CRM. Engineering has Git. Operations has MES.

Strategy has nothing. It still depends on infrequent strategy sessions, memory, and periodic planning.

Phrona provides the infrastructure strategy lacks.

Phrona continuously monitors the convictions your strategy depends on. It watches the external signals most likely to change them and alerts you when the world – and your understanding of it – have begun to diverge.

This document explains what Phrona is, what it isn't, and why we believe every company will eventually need strategy infrastructure.

What is Phrona?

Phrona is infrastructure for strategy.

What is “infrastructure for strategy”?

This is best explained through a few examples:

an energy company commits billions to clean hydrogen production because it believes demand will emerge faster than competitors can respond;

a newly appointed retail CEO eliminates coupons and promotions because he believes customers prefer simple, transparent pricing;

a smartphone company continues investing in physical keyboards because it believes enterprise customers will never abandon them.

What do these decisions have in common? Each is guided by a **CONVICTION** – a belief the company holds to be true.

Every strategy depends on a handful of convictions. The problem: reality shifts; convictions rarely do.

Every other critical business function has infrastructure to keep it grounded in reality – finance has ERP; sales has CRM; manufacturing has MES; engineering has Git. Each exists for the same reason: to ensure decisions are based on today's reality; not yesterday's.

Strategy has no equivalent.

Organizations naturally spend more time executing strategy than revisiting the underlying convictions. The better a company gets at execution, the more dangerous stale convictions become.

Strategy infrastructure keeps convictions grounded in reality.

It tracks the convictions your strategy depends on, continuously monitors the world around you for evidence that could change them. It alerts you when reality begins to diverge from what you believe to be true. By doing so, Phrona helps detect strategic drift before it becomes a strategic failure.

The companies mentioned above? Fortescue. JCPenney. BlackBerry.

Different industries, different strategies, one pattern: reality changed, convictions didn't, and strategy never caught up.

That's the gap strategy infrastructure exists to close.

Why doesn't infrastructure for strategy already exist?

It wasn't practical.

Until recently, markets evolved slowly, and strategy could be revisited periodically without falling behind reality.

Even if you wanted your strategy to reflect the latest intel, it wasn't practical. Doing so required constantly monitoring competitors, markets, regulation, technology, customers, and capital—and connecting those changes back to the specific convictions your strategy depended on. That required more sustained analysis than any leadership team could realistically maintain without a multi-million-dollar management consulting budget.

So, companies settled into an episodic rhythm. They planned, executed, periodically revisited strategy, and relied on leadership intuition between planning cycles.

Today, neither driver holds – reality moves faster than planning cycles can keep pace, and AI has made continuous strategic analysis economically practical.

Infrastructure for strategy has become possible at exactly the moment it has become necessary.

Will every company eventually need strategy infrastructure?

We think so.

Every critical function eventually became too important to manage without infrastructure. We believe strategy has reached that point.

How does Phrona work?

Phrona operates through four moves:

CAPTURE. Phrona maps your convictions, the goals they support, the initiatives they enable, and the relationships among them, creating a living model of your strategy.

MONITOR. Phrona continuously monitors the external drivers that matter because of those convictions – competitors, markets, regulation, technology, customers, and capital.

CHALLENGE. As new evidence emerges, Phrona challenges the convictions underneath your strategy. It identifies contradictions, surfaces weak assumptions, exposes blind spots, and highlights where your thinking no longer reflects reality.

INFORM. Phrona connects new data to your strategy, showing what is now at risk, what else may be affected, and where your attention is needed. The analysis is automated. The judgment remains yours.

Does Phrona make strategic decisions?

No. Phrona is designed to challenge strategy, not replace it.

Phrona questions the convictions underneath your strategy, surfaces evidence that no longer supports them, and forces conversations you might not otherwise have. It never decides what comes next.

Phrona challenges. You exercise judgment.

Can't Claude (or ChatGPT or Gemini) do the same thing?

Not quite. Language models are exceptional thinking partners, but they think in episodes. Every conversation begins from scratch, and any understanding they develop disappears when the conversation ends.

Phrona begins every conversation with your strategy as a living structure. It remembers the convictions your strategy depends on, continuously incorporates new information, and maintains a current understanding of your strategy and the world it operates in.

LLMs provide intelligence. Phrona provides continuity.

Isn't this just a knowledge graph? Or GraphRAG?

No.

Knowledge graphs *organize information* and GraphRAG helps retrieve the right documents and answer questions more accurately.

Phrona *models strategy*. Its graph isn't a library of information. It's a living model of the convictions, goals, initiatives, and dependencies your strategy relies on.

So, it's just competitive intelligence, then?

No.

Competitive intelligence tells you what's happening in the world.

The same competitor announcement, regulatory change, technological breakthrough, or customer trend can be irrelevant to one company and existential to another. Its importance depends entirely on the convictions your strategy rests upon.

Phrona doesn't replace competitive intelligence – it integrates it, calibrating every signal against your strategy. The result is less noise, more relevance.

Isn't this just strategy software? Or another ORK platform?

Strategy software helps document strategy, OKR platforms help execute. Neither asks whether the strategy is still correct.

Phrona does. It doesn't replace planning or execution. It ensures the strategy guiding both remains grounded in reality as the world changes.

Why not just hire a consultant?

The two complement each other – consultants deliver snapshots, Phrona delivers continuity.

Consultants provide perspective at a point in time. But the world continues to change after the engagement ends.

A strategy fit for yesterday may not fit today. Phrona provides continuity between those moments, keeping you informed as the environment changes.

Doesn't my team already own this?

Absolutely.

The CEO and leadership team should own strategy. Phrona was never designed to replace them.

Owning a responsibility, however, is not the same as having infrastructure to support it.

Most teams spend their time executing strategy, not questioning the convictions underneath it. Phrona makes continuous strategic questioning possible.

What changes when a company has infrastructure for strategy?

Strategy stops being an event and becomes a continuous discipline – instead of revisiting strategy only during annual reviews (or after disappointing results force the issue) you gain an ongoing understanding of how a changing world affects the direction of the business.

Conversations change as well – rather than asking “What *happened?*” after the fact, you start asking “What’s *changing?*” while there is still time to respond.

You gain confidence in execution, because the strategy behind it doesn’t quietly grow stale. Convictions become explicit rather than implicit. Strategic discussions become evidence-driven rather than memory-driven.

The result isn’t better strategy in theory—it’s fewer expensive mistakes in practice.

What this means in practice – you:

- | *stop committing capital to opportunities the market has already left behind;*
- | *discover your customers have changed before your declining revenue tells you;*
- | *redirect investment before product development decisions compound on the wrong thesis;*
- | *avoid building an organization optimized to execute a strategy the world has outgrown;*
- | *change direction while it's still inexpensive.*

Strategy infrastructure doesn't eliminate uncertainty – it eliminates **DEAD RECKONING**. Your strategy evolves as the world changes.

Is Phrona just another system to maintain?

No. Phrona exists to reduce strategic overhead, not create it.

Most of the work happens in the background – Phrona continuously gathers information, monitors competitors, tracks regulation, and – most importantly – connects the dots to show what it means for your strategy. It automates the analytical work, allowing you to focus on what technology cannot replace: **JUDGMENT**.

When nothing meaningful changes, Phrona stays quiet. When something does, it tells you what changed, why it matters, and where your attention is needed.

Strategy infrastructure feels less like another tool and more like another member of the team – you don't spend your day working in Phrona; Phrona spends its day working for you.

What does Phrona deliver?

Phrona delivers a continuously current understanding of your strategy and the world around it.

As your company evolves, Phrona incorporates new planning documents, meeting notes, emails, and other strategic context into a living model of your strategy.

At the same time, it continuously monitors competitors, customers, markets, regulation, technology, and capital for developments that matter.

When something meaningful changes, Phrona explains what changed, why it matters, what part of your strategy is affected, and the evidence behind its reasoning. It also provides recurring strategic briefings, and whenever you want to explore an issue more deeply, you can simply ask.

As your model gains richness, so do the capabilities built on top of it – from continuously validating your strategy, to analyzing competitors through the same lens, to rehearsing major decisions before you commit capital.

Phrona is designed to keep you informed – not constantly engaged.

Who is Phrona for?

Phrona is built for companies whose success depends on a few consequential strategic decisions.

Organizations committing significant capital, entering new markets, launching new products, scaling rapidly, or betting on long-term technological shifts all depend on a handful of convictions about how the world works.

As those commitments grow, so does the cost of getting them wrong.

Phrona helps ensure the strategy behind those decisions continues to fit the environment they're unfolding in.

How is our strategy kept private?

Your strategy is one of your most valuable assets and we treat it that way.

Customer data is isolated, access is tightly controlled, and strategy is never shared. Enterprise-grade security and privacy are foundational requirements – not optional features. Your information is used only to support your company's strategic analysis.

What is the Founding Cohort?

We're inviting a small group of companies to help define what strategy infrastructure becomes.

Founding members will deploy Phrona against consequential strategic decisions while working directly with us as the platform evolves. Their feedback will shape not just the product, but the category itself.

Participation is limited because building a new category is something we want to do with a handful of exceptional companies.

How do we get started?

We begin by making your strategy explicit – not only what's written in your planning documents, slide decks, and marketing material – but the convictions, goals, initiatives, and relationships that drive decisions.

Onboarding is collaborative. After that, Phrona works in the background and requires very little from your team.

Every company has convictions it cannot afford to get wrong.

WHAT ARE YOURS?

Ready to explore whether Phrona is a fit for your company – and whether joining the Founding Cohort makes sense? Let's connect.
